

The background of the slide is a complex, abstract composition. It features a network of thin, light-colored lines forming a web-like structure. Overlaid on this are various data points and shapes: a grid of small grey crosses, a series of purple arrows pointing left, a cluster of green dots, and a large, faint, reddish-brown polygonal shape. In the bottom right corner, there are several vertical white lines of varying thickness. The overall color palette is muted, with shades of grey, purple, green, and brown.

# **Limitation of the Support- Confidence Framework**

# How to Judge if a Rule/Pattern Is Interesting?

---

- ❑ Pattern-mining will generate a large set of patterns/rules
  - ❑ Not all the generated patterns/rules are interesting
- ❑ Interestingness measures: Objective vs. subjective
  - ❑ Objective interestingness measures
    - ❑ Support, confidence, correlation, ...
  - ❑ Subjective interestingness measures: One man's trash could be another man's treasure
    - ❑ Query-based: Relevant to a user's particular request
    - ❑ Against one's knowledge-base: unexpected, freshness, timeliness
    - ❑ Visualization tools: Multi-dimensional, interactive examination

# Limitation of the Support-Confidence Framework

- Are  $s$  and  $c$  interesting in association rules: " $A \Rightarrow B$ " [ $s, c$ ]? **Be careful!**
- Example: Suppose one school may have the following statistics on # of students who may play basketball and/or eat cereal:

	play-basketball	not play-basketball	sum (row)
eat-cereal	400	350	750
not eat-cereal	200	50	250
sum(col.)	600	400	1000

2-way contingency table

- Association rule mining may generate the following:
  - $play\text{-}basketball \Rightarrow eat\text{-}cereal$  [40%, 66.7%] (higher  $s$  &  $c$ )
- But this strong association rule is misleading: The overall % of students eating cereal is 75% > 66.7%, a more telling rule:
  - $\neg play\text{-}basketball \Rightarrow eat\text{-}cereal$  [35%, 87.5%] (high  $s$  &  $c$ )

The background of the slide is a complex, abstract composition. It features a network of thin, reddish-brown lines connecting various points, creating a web-like structure. Interspersed among these lines are numerous small, colored dots in shades of green, blue, and orange. The overall aesthetic is technical and data-driven, with a mix of organic and geometric forms. A large, white, angular shape serves as a backdrop for the title text.

# Interestingness Measures: Lift and $\chi^2$

# Interestingness Measure: Lift

- Measure of dependent/correlated events: **lift**

$$\text{lift}(B, C) = \frac{c(B \rightarrow C)}{s(C)} = \frac{s(B \cup C)}{s(B) \times s(C)}$$

- Lift(B, C) may tell how B and C are correlated

- Lift(B, C) = 1: B and C are independent
- > 1: positively correlated
- < 1: negatively correlated

- For our example,  $\text{lift}(B, C) = \frac{400 / 1000}{600 / 1000 \times 750 / 1000} = 0.89$   
 $\text{lift}(B, \neg C) = \frac{200 / 1000}{600 / 1000 \times 250 / 1000} = 1.33$

- Thus, B and C are negatively correlated since  $\text{lift}(B, C) < 1$ ;
  - B and  $\neg C$  are positively correlated since  $\text{lift}(B, \neg C) > 1$

Lift is more telling than s & c

	B	$\neg B$	$\Sigma_{\text{row}}$
C	400	350	750
$\neg C$	200	50	250
$\Sigma_{\text{col.}}$	600	400	1000

# Interestingness Measure: $\chi^2$

- Another measure to test correlated events:  $\chi^2$

$$\chi^2 = \sum \frac{(Observed - Expected)^2}{Expected}$$

- General rules

- $\chi^2 = 0$ : independent
- $\chi^2 > 0$ : correlated, either positive or negative, so it needs additional test

- Now,  $\chi^2 = \frac{(400 - 450)^2}{450} + \frac{(350 - 300)^2}{300} + \frac{(200 - 150)^2}{150} + \frac{(50 - 100)^2}{100} = 55.56$

- $\chi^2$  shows B and C are negatively correlated since the expected value is 450 but the observed is only 400
- $\chi^2$  is also more telling than the support-confidence framework

	B	$\neg B$	$\Sigma_{\text{row}}$
C	400 (450)	350 (300)	750
$\neg C$	200 (150)	50 (100)	250
$\Sigma_{\text{col}}$	600	400	1000

Expected value

Observed value

# Lift and $\chi^2$ : Are They Always Good Measures?

- ❑ Null transactions: Transactions that contain neither B nor C
- ❑ Let's examine the dataset D
  - ❑ BC (100) is much rarer than B¬C (1000) and ¬BC (1000), but there are many ¬B¬C (100000)
  - ❑ Unlikely B & C will happen together!
- ❑ But,  $\text{Lift}(B, C) = 8.44 \gg 1$  (Lift shows B and C are strongly positively correlated!)
- ❑  $\chi^2 = 670$ : Observed(BC)  $\gg$  expected value (11.85)
- ❑ *Too many null transactions may "spoil the soup"!*

	B	¬B	$\Sigma_{\text{row}}$
C	100	1000	1100
¬C	1000	100000	101000
$\Sigma_{\text{col.}}$	1100	101000	102100

*null transactions*

Contingency table with expected values added

	B	¬B	$\Sigma_{\text{row}}$
C	100 (11.85)	1000	1100
¬C	1000 (988.15)	100000	101000
$\Sigma_{\text{col.}}$	1100	101000	102100

The background of the slide is a complex, abstract composition. It features a dark, reddish-brown base with a network of thin, light-colored lines forming a triangular mesh. Scattered throughout are small, colorful dots in shades of green, blue, and orange. A prominent white banner with a slight 3D effect and a drop shadow runs horizontally across the center. On the left side, there is a smaller, semi-transparent rectangular inset showing a different pattern of dots and lines. The overall aesthetic is technical and modern.

# Null Invariance Measures

# Interestingness Measures & Null-Invariance

- ❑ **Null invariance**: Value does not change with the # of null-transactions
- ❑ A few interestingness measures: Some are null invariant

Measure	Definition	Range	Null-Invariant
$\chi^2(A, B)$	$\sum_{i,j=0,1} \frac{(e(a_i b_j) - o(a_i b_j))^2}{e(a_i b_j)}$	$[0, \infty]$	No
$Lift(A, B)$	$\frac{s(A \cup B)}{s(A) \times s(B)}$	$[0, \infty]$	No
$AllConf(A, B)$	$\frac{s(A \cup B)}{\max\{s(A), s(B)\}}$	$[0, 1]$	Yes
$Jaccard(A, B)$	$\frac{s(A \cup B)}{s(A) + s(B) - s(A \cup B)}$	$[0, 1]$	Yes
$Cosine(A, B)$	$\frac{s(A \cup B)}{\sqrt{s(A) \times s(B)}}$	$[0, 1]$	Yes
$Kulczynski(A, B)$	$\frac{1}{2} \left( \frac{s(A \cup B)}{s(A)} + \frac{s(A \cup B)}{s(B)} \right)$	$[0, 1]$	Yes
$MaxConf(A, B)$	$\max\left\{ \frac{s(A)}{s(A \cup B)}, \frac{s(B)}{s(A \cup B)} \right\}$	$[0, 1]$	Yes

*$\chi^2$  and lift are not null-invariant*

*Jaccard, cosine, AllConf, MaxConf, and Kulczynski are null-invariant measures*

# Null Invariance: An Important Property

□ Why is null invariance crucial for the analysis of massive transaction data?

□ Many transactions may contain neither milk nor coffee!

milk vs. coffee contingency table

	<i>milk</i>	$\neg milk$	$\Sigma_{row}$
<i>coffee</i>	<i>mc</i>	$\neg mc$	<i>c</i>
$\neg coffee$	<i>m</i> $\neg c$	$\neg m$ $\neg c$	$\neg c$
$\Sigma_{col}$	<i>m</i>	$\neg m$	$\Sigma$

□ Lift and  $\chi^2$  are not null-invariant: not good to evaluate data that contain too many or too few null transactions!

□ Many measures are not null-invariant!

Null-transactions  
w.r.t. *m* and *c*

Data set	<i>mc</i>	$\neg mc$	<i>m</i> $\neg c$	$\neg m$ $\neg c$	$\chi^2$	<i>Lift</i>
<i>D</i> <sub>1</sub>	10,000	1,000	1,000	100,000	90557	9.26
<i>D</i> <sub>2</sub>	10,000	1,000	1,000	100	0	1
<i>D</i> <sub>3</sub>	100	1,000	1,000	100,000	670	8.44
<i>D</i> <sub>4</sub>	1,000	1,000	1,000	100,000	24740	25.75
<i>D</i> <sub>5</sub>	1,000	100	10,000	100,000	8173	9.18
<i>D</i> <sub>6</sub>	1,000	10	100,000	100,000	965	1.97

The background of the slide is a complex, abstract composition. It features a network of thin, reddish-brown lines connecting various points, creating a web-like structure. Scattered throughout are numerous small, colored dots in shades of green, blue, and orange. On the left side, there is a vertical strip containing a grid of small, light-colored plus signs. In the center, a large, white, angular shape serves as a backdrop for the title text. The overall aesthetic is technical and data-driven.

# **Comparison of Null-Invariant Measures**

# Comparison of Null-Invariant Measures

- ❑ Not all null-invariant measures are created equal
- ❑ Which one is better?
  - ❑  $D_4 - D_6$  differentiate the null-invariant measures
  - ❑ Kulc (Kulczynski 1927) holds firm and is in balance of both directional implications

2-variable contingency table

	<i>milk</i>	$\neg milk$	$\Sigma_{row}$
<i>coffee</i>	<i>mc</i>	$\neg mc$	<i>c</i>
$\neg coffee$	<i>m</i> $\neg c$	$\neg m \neg c$	$\neg c$
$\Sigma_{col}$	<i>m</i>	$\neg m$	$\Sigma$

All 5 are null-invariant

Data set	<i>mc</i>	$\neg mc$	<i>m</i> $\neg c$	$\neg m \neg c$	<i>AllConf</i>	Jaccard	<i>Cosine</i>	<i>Kulc</i>	<i>MaxConf</i>
$D_1$	10,000	1,000	1,000	100,000	0.91	0.83	0.91	0.91	0.91
$D_2$	10,000	1,000	1,000	100	0.91	0.83	0.91	0.91	0.91
$D_3$	100	1,000	1,000	100,000	0.09	0.05	0.09	0.09	0.09
$D_4$	1,000	1,000	1,000	100,000	0.5	0.33	0.5	0.5	0.5
$D_5$	1,000	100	10,000	100,000	0.09	0.09	0.29	0.5	0.91
$D_6$	1,000	10	100,000	100,000	0.01	0.01	0.10	0.5	0.99

Subtle: They disagree on those cases

# Imbalance Ratio with Kulczynski Measure

- IR (Imbalance Ratio): measure the imbalance of two itemsets A and B in rule implications:

$$IR(A, B) = \frac{|s(A) - s(B)|}{s(A) + s(B) - s(A \cup B)}$$

- Kulczynski and Imbalance Ratio (IR) together present a clear picture for all the three datasets  $D_4$  through  $D_6$ 
  - $D_4$  is neutral & balanced;  $D_5$  is neutral but imbalanced
  - $D_6$  is neutral but very imbalanced

Data set	$mc$	$\neg mc$	$m\neg c$	$\neg m\neg c$	Jaccard	<i>Cosine</i>	<i>Kulc</i>	IR
$D_1$	10,000	1,000	1,000	100,000	0.83	0.91	0.91	0
$D_2$	10,000	1,000	1,000	100	0.83	0.91	0.91	0
$D_3$	100	1,000	1,000	100,000	0.05	0.09	0.09	0
$D_4$	1,000	1,000	1,000	100,000	0.33	0.5	0.5	0
$D_5$	1,000	100	10,000	100,000	0.09	0.29	0.5	0.89
$D_6$	1,000	10	100,000	100,000	0.01	0.10	0.5	0.99

# Example: Analysis of DBLP Coauthor Relationships

Recent DB conferences, removing balanced associations, low sup, etc.
